Nurserymen and Tree Seedsmen

GERMANTOWN, PHILA., U.S.A.

Cable Address Meehan, Phila. A, B, C Code, 4th edition.

AS WE COLLECT but few more seeds than our usual sales warrant, those expecting to need large quantities for forestry or other purposes are solicited to write us early, that we may arrange for collecting them.

We do our best to send out sound and perfect seeds, but in the case of oaks, hickories and chestnuts the seeds are sometimes wormy, a defect that cannot be detected until the worm eats its way out, often after the seeds leave our hands. There are trees, too, that never perfect all their seeds—the Acer, saccharinum and Liriodendron are examples—and there is no way to separate the imperfect seeds.

Not less than one-quarter pound will be supplied at pound rates nor one-quarter bushel at bushel rates. Half ounces will be supplied at ounce rates where the price per ounce is not lower than 20c. No packet put up for less than 10c. Satisfactory arrangements for payment must accompany orders from unknown correspondents.

When seeds are to go by mail, the charge is 9c per pound additional. P. O. orders payable at Philadelphia.

## Germination of the Seeds

Seeds of deciduous trees and shrubs are best sown in Fall, pines and similar evergreens in Spring, but deciduous ones will grow very well sown in Spring if kept in good condition through the Winter. When sown in Spring seeds of a hard, bony nature, such as the yellow locust, are best soaked in hot water for a day or two and then sown at once. Seeds of maples, ash, magnolia, beech, all nut trees, as well as many other kinds, require to be kept slightly moist over Winter if not sown in Fall; on the other hand, catalpa and some others may be kept quite dry until Spring comes.

All Spring sowings should be early; even if the ground freezes later it won't injure the seeds at all.

Junipers, hollies and a few similar seeds remain a full year before sprouting. It is just as well, therefore, to keep them in a box of soil until the next Autumn, then sow them.

These directions should insure tolerable success in raising seedlings. The greater the experience, of course, the greater the success.

To germinate, seeds require certain conditions of moisture, temperature and time which they do not always meet with after sowing, hence fail to appear the first season. Examine them at the close of Spring, and if found sound do not disturb them, and their germination may be looked for the season following.

## Notice

We wish to remind our customers that while using our best efforts to supply such seeds as will prove satisfactory we give no warranty as to quality or productiveness or percentage of growth, there being too many causes known and unknown which prevent good seeds from germinating. Orders are accepted and shipped on these terms. Samples will be furnished when applied for. Should shipments received prove unsatisfactory from any cause, customers will kindly notify us within seven days, otherwise it is understood the seeds are accepted.

## Our Reputation

Our firm has been in the seed and nursery business for over 50 years and has correspondents all over the world. We have still customers buying from us whose names were among the first on our books. Having 250 acres in nursery, we can make use of seeds unsold, enabling us to have fresh seeds to offer every season.

## Hints on Seed Sowing

The general practice in sowing seeds is to sow them broadcast, in beds three feet in width, which allows of weeding the seedlings as they grow. The young plants are transplanted when two or three years old. The covering of seeds with soil is to be regulated by the size of the seeds. An acorn or a hickory nut of a thickness of an inch should have a covering of two inches of soil, while those of dust-like size require but little more than a dusting of soil over them.

A light soil is better for seeds than a heavy one; in fact, sand alone has been found good for covering seeds, allowing the seeds to push freely through it.

Shade is a great help; in fact, almost necessary, as seeds germinate best in darkness. This is best afforded by a covering of forest leaves, kept in place by a skeleton frame or some other contrivance. The leaves should be removed gradually when the seedlings commence to appear above ground, as light is needed then.

We are often asked whether when walnuts and other nuts are wanted for forestry purposes the nuts can be set where trees are wanted. We do not recommend it. Rarely every nut grows, so that there would be many vacancies under the plan. Better to sow in beds and transplant later.
